Tosyalı Demir Çelik San. A.Ş. has the sole ownership, liability, and responsibility for the EPD. EPDs within the same product category but from different programmes may not be comparable. EPDs of construction products may not be comparable if they do not comply with EN 15804. For further information about comparability, see EN 15804 and ISO 14025.

Investments in our facilities started in 1993 and the production started in 1994. In 1995, equal angles was added to the production matrices. With the investment in 2001, the 2nd Rolling Mill was established and its current capacity doubled. And IPN-UPN-IPE profile is added to the product group. Tosyalı Demir Çelik rolling mill facilities in İskenderun are established on a total area of 17,667 m² with 13,000 m² closed area. The annual production capacity is 550,000 tons / year.

The following standard and special sizes are produced in the following groups in Tosyalı Demir Çelik facilities:

- From 30 mm to 120 mm / 2.8 mm to 13 mm flange thickness in the equal angles group,
- From 50 mm to 160 mm in the UPN profile (Taper flange channels) group,
- From 80 mm to 160 mm in the IPN profile (Taper flange I sections) group,
- From 80 mm to 160 mm in the IPE profile (Parallel flange I sections) group.

For all of our products, heat-based tensile tests, chemical tests, bending tests and charpy impact tests are performed in our own laboratories.

Follow-up and control of all quality system documentation is performed by using the QDMS system. All information about our products is recorded in our SAP system database. Especially with the barcode system on the product package labels, traceability is ensured until the product reaches the customer.

In Tosyalı Demir Çelik facilities, these products are made by forming 130# and 150# square billet raw materials by heating them in the furnace up to 1250 degrees and hot forming them through rotating rollers. These materials, made especially by hot forming, have a more strong structure due to homogeneous shrinkage of grain sizes.

These materials are used especially in energy transmission line, as well as all steel constructions, machinery manufacturing industries, and various structures.

Exporting its products to 33 countries, Tosyalı Demir Çelik facilities continue its activities that shape the industry and its local and international investments that will contribute to the country, people and nature.

Production Site

Tosyalı Demir Çelik

Organize Sanayi Bölgesi Sarıseki, İskenderun / HATAY

Product Information

Product Name: **Profile**

Hot rolled profile products production facilities were established in Hatay. The facility provides services in a total area of 17,667 m² with 13,000 m² closed area. The annual production capacity is 550,000 tons/year. In this facility UPN profile, IPN profile and IPE profiles are produced.

Intended Use of Product

Profile is used especially in energy transmission line, as well as all steel constructions, machinery manufacturing industries, and various structures.

Production

In the profile production plant, firstly, 130x130 mm and 150x150 mm billet are heated in the furnace up to 1,250 °C. Then it passes through the rotating rollers and is formed by hot forming. These materials, especially made by hot shaping, gain a more durable structure due to the homogeneous reduction of grain sizes. Electricity, water, and natural gas are consumed in these stages.

End of the processes the profile is ready and packaged to be delivered to the customer.

Technical Specifications

Product	Production Standards	Description
Profile	ASTM A6 / A6M	Standard Specification for General Requirement for Rolled Structural Steel Bars, Plate, Shape and Sheet Piling
	EN 10025-1 : 2004	Certificate of Conformity of the Factory Production Control
	EN 10024	From IPN 80 to 160 Hot Rolled Taper Flange Steel I profile
	EN 10279	From UPN 50 to UPN 160 Hot Rolled Taper Flange U Channels
	EN 10034	From IPE 80 to IPE 160 Hot Rolled Parallel Flange Steel I profile

LCA Information

Declared unit

1000 kg of Profile manufactured in Hatay facility (TR).

Reference service life

Not applicable

Time representativeness

The inventory for the LCA study is based on the period of 1st January 2021 and 31st December 2021

Database(s) and LCA software used

SimaPro LCA v9.2.0.2 software with Ecoinvent v3.7.1

Description of system boundaries

Cradle to gate with options, modules, C1-C4, D (A1-A3 + C + D)

Data quality and data collection

Data collection for this LCA study has been carried out in accordance with data requirement stated in ISO 14040-44, ISO 14025, ISO 14020, and the requirements given in the General Program Instructions v3.01; PCR Construction products 2019:14, version 1.11 by The International EPD® System and EN 15804:2012+A2:2019.

There are two different data classifications has been used as primary (specific) and secondary (selected generic) data. All primary data has been collected from the manufacturing plant. For secondary data Ecoinvent v3.7.1 database has been used.

Upstream data, raw materials production, transportation, fossil fuels and electricity mix data have been obtained from Ecoinvent v3.7.1 as secondary data. All manufacturing data in core processes has been gathered from the manufacturing plant. The manufacturing data are collected based on a mass balance. The profile datas in this LCA study represents the period of 1st January 2021 and 31th December 2021.

Mileage and tonnage figures for transport data to the core processes were provided by Tosyali's other plant procurement department specifically per origin of departures, however roadway upstream data per ton per kilometres were taken from Ecoinvent v3.7.1

Allocation

Mass allocation applied for waste generated during the production of the profile and equal angles. The waste data has been allocated to profile and equal angles taking into account the total production in the relevant time period.

It has been calculated that 50% of the total waste produced in the facility will be on the profile, 50% on the equal angles.

The same percentages were used to allocate the packaging products and air emissions for two products.

Cut-off rules

Life Cycle Inventory data for a minimum of 99 % of total inflows to the three life cycle stages have been included and a cut-off rule of 1% regarding energy, mass, and environmental relevance was applied.

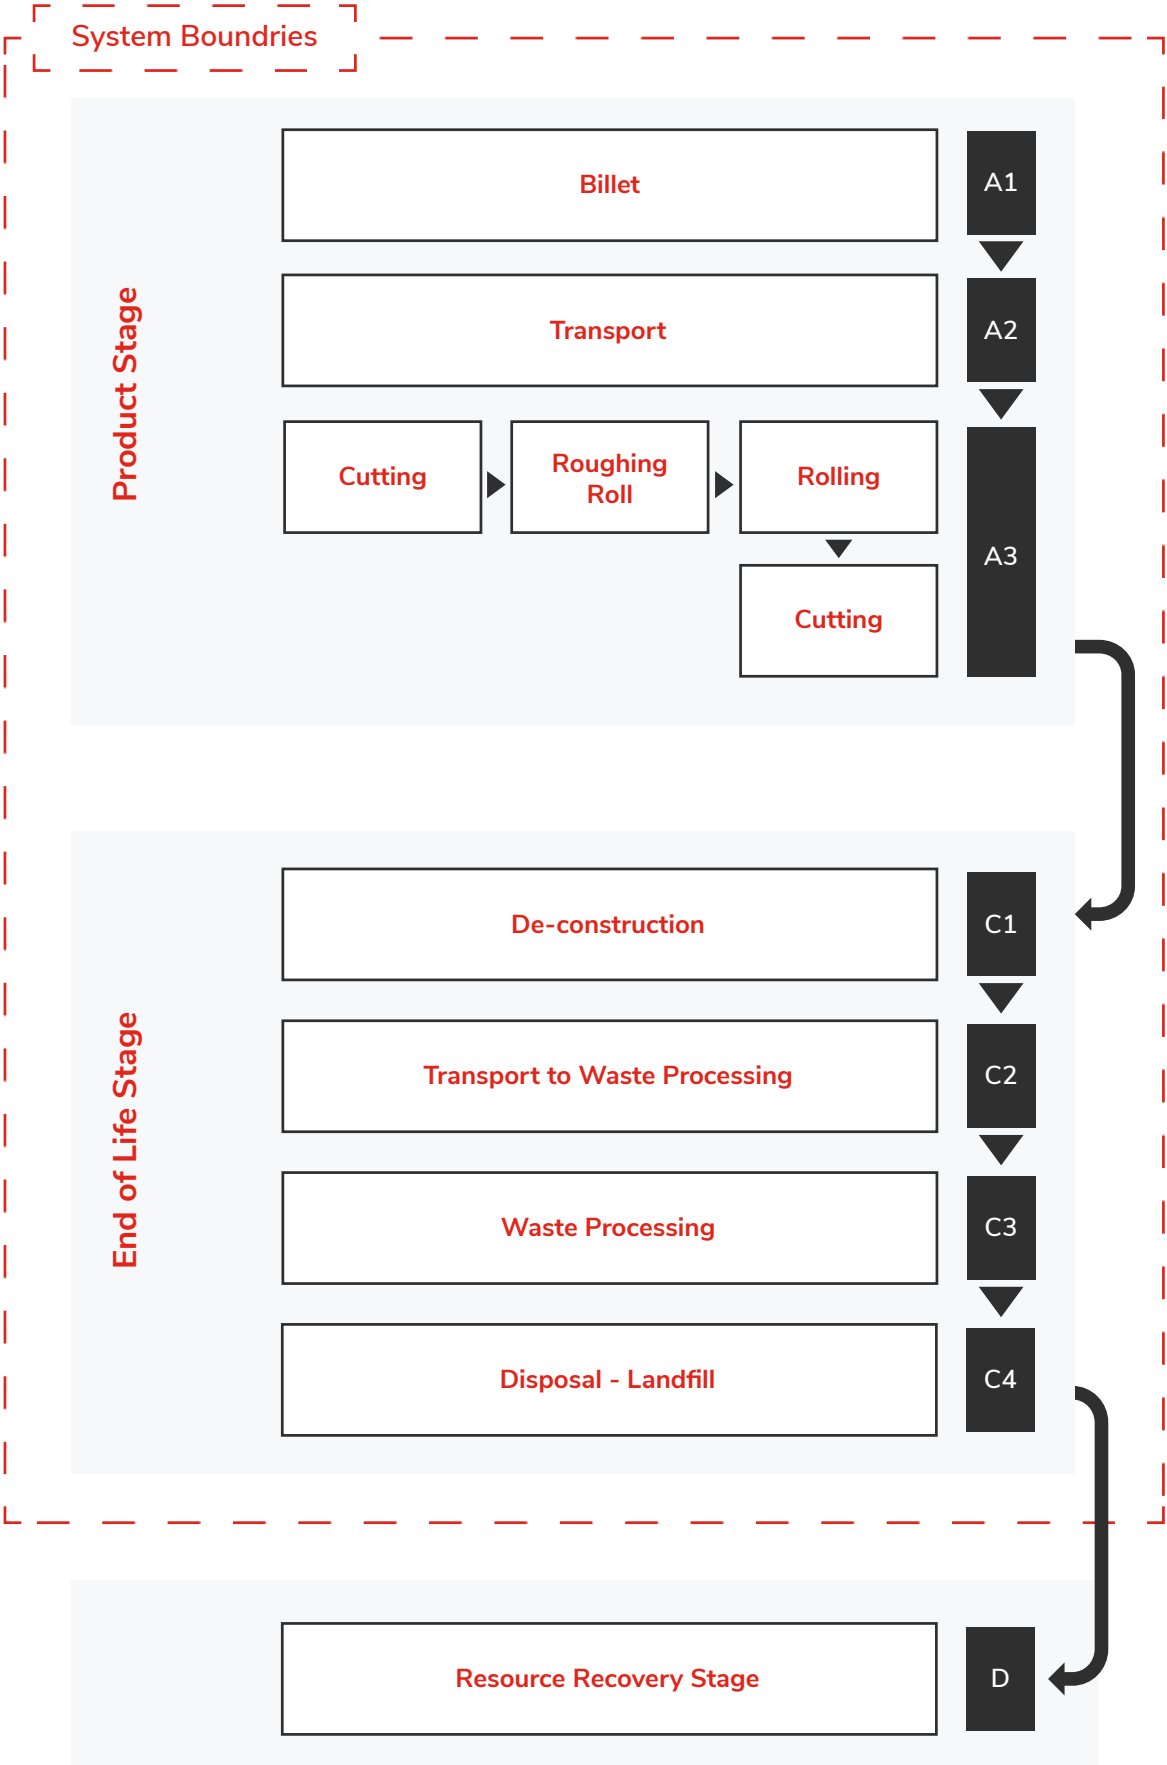

Modules declared, geographical scope, share of specific data (in GWP-GHG indicator) and data variation

System Diagram

Description of declared modules

A1 - Raw Materials Supply

This module takes into account raw material extraction, processing and energy used in the production process.

A2 - Transport to the Manufacturer

This module includes transportation of the raw materials from supplier to factory gate. Transportation types are considered as roadway.

A3 - Manufacturing

This stage includes energy and water consumption during the manufacturing process. Additionally, packaging materials are covered in this module. The processing of any waste arising from this stage is also included.

C1 - De-construction

The de-construction and demolition of modules C1 are assumed to be carried out by diesel-powered machinery using a fuel cost of 0.01 kWh / kg of material at the end of their lifecycle.

C2 - Transport to Waste Processing

An average distance of 100 km has been assumed for the transport to sorting facility. Transport is calculated on the basis of a scenario with the parameters described in the attached table.

Parameters C2 Module	
Transport by road*	Lorry, 16-32 metric ton
Distance (km)	100
Database	Ecoinvent v3.7.1

*Technology is Euro 6

C3 - Waste processing for reuse, recovery and/or recycling

During the pre-recycling process of recycling materials, they are separated so that they can then be effectively recycled. As a result of this processing stage, there are negligible impacts. Material that is intended for reuse does not undergo any processing prior to reusing it in another construction site, hence the zero environmental impact.

C4 - Final disposal

100% of end-of-life products will be collected and recycled into the production system. Profile products are recycled. A total of 95% of end-of-life products are recycled and reused in construction projects or construction material production processes. 5% of the products are sent to the landfill.

D - Reuse, Recovery or Recycling Potential

Profile inputs to the production stage are subtracted from the construction to be recycled at end-of-life in order to obtain the profile from the product system. This remaining net profile is then sent to recycling. Module D reports the environmental aspects of recycled scrap generated at the end of life minus that used at the production stage.

Information on which life cycle stages are not considered

This EPD only cover the Cradle to Gate with options A1-3 and C1-4 and D stages because other stages are very dependent on particular scenarios and are better developed for specific building or construction works.

Content Declaration

Content declaration of 1000kg of profile	
Material	Share
Scrap iron	99.0-99.9%
